"Complete cDNA sequence of a caffeic acid O-methyltransferase from
"Coffea canephora fruit.",
Submitted (DEC-2001) to the EMBL/GenBank/DBBJ databases.
-!- FUNCTION: Catalyzes the conversion of caffeic acid to ferulic acid
and of 5-hydroxyferulic acid to shapic acid. The resulting
products may subsequently be converted to the corresponding
alcohols that are incorporated into lighins.
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 3,4-dihydroxy-trans-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cinnamate = S-adenosyl-L-homocysteine + 3-methoxy-4-hydroxy-trans-

Blochem. Blophys. 375:385-388(2000).

-!- FUNCTION: Methylates OH residues of flavonoid compounds. Substrate preference is quercetin > myricetin.> luteolin. Dihydroquercetin is not a substrate. Has an optimal pH of 7.5.

-!- CATALYTIC ACTIVITY: Sadenosyl-L-methionine + 3,5,7,3',4'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -i- SUBUNIT: Monomer.
-i- SIMILARITY: Belongs to the methyltransferase superfamily. Family

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cDNA from Capsicum annuum.";
Submitted (DEC-1999) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Catalyzes the conversion of caffeic acid to ferulic acid and of 5-hydroxyferulic acid to sinapic acid. The resulting products may subsequently be converted to the corresponding alcohols that are incorporated into lignins.
-!- CATALYTIC ACTIVITY: S_adenosyl-L-methionine + 3,4-dihydroxy-trans-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TISSUE SPECIFICITY: Fruit. Not expressed in leaf.
DEVELOPMENTAL STAGE: Expression increases during fruit development
but decreases during ripening.
SIMILARITY: Belongs to the methyltransferase superfamily. Family

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Schroeder G., Weininger E., Schroeder J.,

"Molecular and biochemical characterization of caffeic acid O-
"methyltransferase from Catharanthus roseus ";
Submitted Marazoul) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Catalyzes the conversion of caffeic acid to ferulic acid
and of 5-hydroxyferulic acid to sinapic acid. The resulting
products may subsequently be converted to the corresponding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               alcohols that are incorporated into lignins. 3,4-dihydroxy-trans-CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 3,4-dihydroxy-transcinnamate = S-adenosyl-L-homocysteine + 3-methoxy-4-hydroxy-trans-

                                                                                                                                           CC 5,7,3',4'-
Dentahydroxyflavone = S-adenosyl-L-methionine + 3,5,7,3',4'-
Dentahydroxyflavone = S-adenosyl-L-homocysteine + 3-methoxy-
S,7,3',4'-terrahydroxyflavone.
CC -!- FATHWAY: Phenylpropanoid pathway.
CC -!- MISCELLANBOUS: The Vmax value for flavonoid compounds is two to
threefold higher for OWT1 than for OWT2.
CC -!- GNMILARITY: Belongs to the methyltransferase superfamily. Family
C -!- CAUTION: It is not sure if OWT1 and OWT2 are really encoded by two
different genes or if they represent cloning artifacts.
CC -!- CAUTION: In they represent cloning artifacts.

               -!- FUNCTION: Methylates OH residues of flavonoid and phenylpropano compounds and shows a higher affinity for flavonoid than phenylpropanoid substrates. Substrate preference is quercetin (flavonoid) = luteolin (flavonoid) > 5-hydroxyferulic acid (phenylpropanoid) >> apigenin (flavonoid) = kempferol (flavonoid) >> apigenin (flavonoid) = kempferol (flavonoid).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-AUG-1992 (Rel. 23, Last sequence update)

"Nucleotide sequence of a caffeic acid 3-0-methyltransferase gene from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PUNCTION: Catalyzes the conversion of caffeic acid to ferulic acid and of 5-hydroxyferulic acid to sinapic acid. The resulting products may subsequently be converted to the corresponding alcohols that are incorporated into lighins.

CATALYTIC ACTIVITY: 8-adenosyl-L-methionine + 3,4-dihydroxy-transcinnamate = 8-adenosyl-L-homocysteine + 3-methoxy-4-hydroxy-trans-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  34 LKMMVELDIPDIIHSHSHGQPITFSELVSILQVPPTKTRQVQSLMRYLAHNGFFEIVRIH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SIMILARITY: Belongs to the methyltransferase superfamily. Family 2. COMT subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Capsicum chinense (Scotch bonnet) (Bonnet pepper).

"Characterization of two cDNA clones which encode O-methyltransferases for the methylation of both flavonoid and phenylpropanoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CAUTION: It is not sure if OMT1 and OMT2 are really encoded by two different genes or if they represent cloning artifacts.
                                                                                                                                                                                                                                                                                                                                                                                       Arch. Biochem. Biophys. 351:243-249(1998).

-!- FUNCTION: Methylates CH residues of flavonoid and phenylpropanoid compounds and shows a higher affinity for flavonoid than phenylpropanoid substrates. Substrate preference is quercetin (flavonoid) = luteolin (flavonoid) = 5-hydroxyferulic acid (phenylpropanoid) > caffeic acid (phenylpropanoid) > apigenin (flavonoid) = kempferol (flavonoid).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  123 VLDGGIPPNKAYGMSSFEYHGTDPRPNKVPNKGMSDHSTITMKKVPQTYQGFQGLTSLVD

pentahydroxyflavone = S-adenosyl-L-homocysteine + 3-methoxy-
-!- PATHWAY: Phenylproyanoid pathway.
-!- PATHWAY: Phenylpropanoid pathway.
-!- MISCELLANEOUS: The Vmax value for flavonoid compounds is two to
threefold lower for OMT2 than for OMT1.
-!- SIMILARITY: Belongs to the methyltransferase superfamily. Family
                                                                      Chrysosplenium americanum (Golden saxifrage).
Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta,
Spermatophyta, Magnoliophyta, eudicotyledons, core eudicots,
Saxifragales, Saxifragaceae; Chrysosplenium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: Catalyzes the conversion of caffeic acid to ferulic acid and of 5-hydroxyferulic acid to sinapic acid. The resulting products may subsequently be converted to the corresponding alcohols that are incorporated into lignins.

CATALYTIC ACTILITY: S-adenosyl-L-methionine + 3.4-dihydroxy-transcinnamate = S-adenosyl-L-homocysteine + 3-methoxy-4-hydroxy-transcinnamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PATHWAY: Lignin biosynthesis. SIMILARITY: Belongs to the methyltransferase superfamily. Family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (CAOMT-1).

Submitted (JUL-1997) to the BMBL/GenBank/DBM databases.

-!- RUNCTION: Catalyzes the conversion of caffeic acid to ferulic acid
and of 5-hydroxyferulic acid to sinapic acid. The resulting
products may subsequently be converted to the corresponding
alcohols that are incorporated into lignins.

-!- CATALYMIC ACTIVITY: 5-adenosyl-L-methionine + 3.4-dihydroxy-trans-
cinnamate = S-adenosyl-L-homocysteine + 3-methoxy-4-hydroxy-trans-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Catalyzes the conversion of caffeic acid to ferulic acid and of 5-hydroxyferulic acid to sinapic acid. The resulting products may subsequently be converted to the corresponding alcohols that are incorporated into lignins.

CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 3.4-dihydroxy-transcinnamate = S-adenosyl-L-homocysteine + 3-methoxy-4-hydroxy-transcinnamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -----EIVRIHDNIEAYALTAASELLVKSSE-LSLAPMVEYFLEPNCQGAWNQLKRW

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
